Installing VCS agent for IBM SAN Volume Controller copy services

The VCS agent used to support remote copy services on IBM Storwize V7000 system is the same agent that has been used in previous VCS configurations with IBM SAN Volume Controller. Despite the agent name (IBM SVCCopyServices) the required resource attributes are applicable to both SAN Volume Controller and Storwize V7000 disk systems.

For complete details refer to the *Veritas Cluster Server Agent for IBM SVCCopyServices Installation and Configuration Guide* at:

https://sort.symantec.com/agents/download_docs/2192/vcs_svc_install

You must install the IBM SAN Volume Controller copy services agent on each node in the cluster. In global cluster environments, install the agent on each node in each cluster. These instructions assume that the Veritas Cluster Server is already installed. Perform the following steps to install the agent.

1. Make sure the disk is mounted. See "Mounting a Software Disk".
2. Run the following command to navigate to the location of the agent packages:

```
# cd /cdrom/aix/replication/svccopyservices_agent /version/pkg
```

The variable *version* represents the version of the agent. In this scenario, version 5.0.3.0 has been installed.

3. Run the following command to add the file sets for the software.

```
# installp -ac -d VRTSvcssvc.rte.bff VRTSvcssvc
```

All the required software components have now been installed. You should be able to list out the filesets that are mentioned in the "Appendix D: Veritas Software file sets listing" on each application host.

Installing and configuring Oracle

Installing and configuring Oracle involves the following tasks:

- Installation of Oracle software
- Creation of an Oracle instance
- Creation of the database

First, you need to install Oracle on all nodes in both clusters. Make sure that the installation prerequisites are met and are identical on all nodes, especially the user and group ID, passwords, owner and group permissions and listener port ID. Refer to the appropriate "Appendix B: Setting up the database applications" section for instructions to setup the database.

In this configuration, a database representing **testmm** schema is built. A database workload application is used to populate and simulate a Transaction Processing Performance Council OLTP (TPC-C) workload. You will need a workload application to exercise the database load.
